

Abstract

A color correction apparatus is provided including a color correction means 1 for making a color correction to an input image signal 101, and a color gamut compression means 2
5 for performing color gamut compression on the color-corrected input image signal based on color reproduction characteristics data 103 describing color reproduction characteristics so that the color-corrected image data outputted from the color
correction means 1 has a chromaticity range which is contained
10 in a color reproduction region which is based on the color reproduction characteristics.
